Abstract

In this vignette, we give short examples how to produce new distributions in packages "distr" and "distrEx". This vignette refers to package version 2.5.3.

Basically there are three ways to produce new distributions in packages "distr" and "distrEx":

- 1. automatic generation of single distribution objects by arithmetics and the like
- 2. using generating functions to produce single distribution objects
- 3. defining new distribution classes / doing it from scratch

We will give short examples of all three of them.

^{*}Fraunhofer ITWM, Kaiserslautern

 $^{^{\}dagger}\mathrm{FH}$ Furtwangen

1 Automatic generation by arithmetics and the like

We have made available quite general arithmetical operations to our distribution objects, generating new image distribution objects automatically. As an example, try

```
> require(distr)
> N \leftarrow Norm(mean = 2, sd = 1.3)
> P \leftarrow Pois(lambda = 1.2)
> Z \leftarrow 2*N + 3 + P
> Z
Distribution Object of Class: AbscontDistribution
> plot(Z, panel.first = grid(), lwd=2)
> p(Z)(0.4)
[1] 0.002415387
> q(Z)(0.3)
[1] 6.705068
> Zs \leftarrow \mathbf{r}(Z)(50)
> Zs
 [1] 10.520052
                  8.288735
                             6.840536 \ 10.456623
                                                   4.894376
                                                               8.618621

```

Comment:

Let N an object of class "Norm" with parameters mean=2, sd=1.3 and let P an object of class "Pois" with parameter lambda=1.2. Assigning to Z the expression 2*N+3+P, a new distribution object is generated —of class "AbscontDistribution" in our case— so that identifying N, P, Z with random variables distributed according to N, P, Z, $\mathcal{L}(Z) = \mathcal{L}(2*N+3+P)$, and writing p(Z)(0.4) we get $P(Z \leq 0.4)$, q(Z)(0.3) the 30%-quantile of Z, and with r(Z)(50) we generate 50 pseudo random numbers distributed according to Z, while the plot command generates the above figure.

There a caveats to take care about; for details refer to the (larger) vignette distr in package "distrDoc".

2 Using generating functions

If you want to generate a single distribution object (without any particular parameter) generating functions are the method of choice:

Objects of classes LatticeDistribution resp. DiscreteDistribution, AbscontDistribution, may be gen-

erated using the generating functions LatticeDistribution() resp. DiscreteDistribution() resp. AbscontDistribution(); see also the corresponding help.

E.g., to produce a discrete distribution with support (1, 5, 7, 21) with corresponding probabilities (0.1, 0.1, 0.6, 0.2) we may write

```
> D \leftarrow DiscreteDistribution (supp = c(1,5,7,21), prob = c(0.1,0.1,0.6,0.2)) > D
```

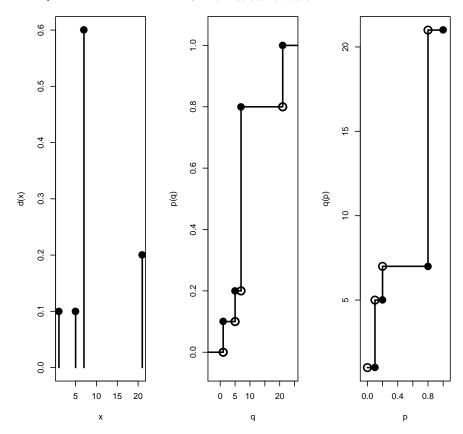

Distribution Object of Class: DiscreteDistribution

```
> plot(D, panel.first = grid(), lwd = 2)
```

\$lwd [1] 2

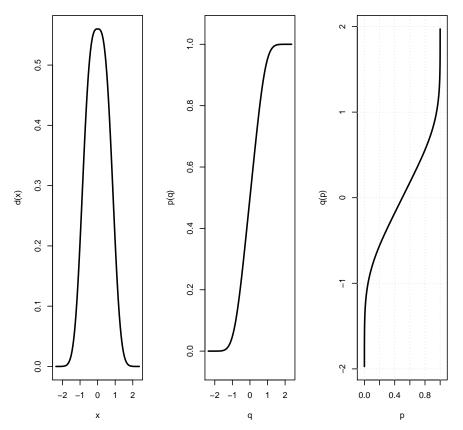

obability function of DiscreteDistr

CDF of DiscreteDistribution!uantile function of DiscreteDistril

and to generate an absolutely continuos distribution with density proportional to $e^{-|x|^3}$, we write > AC \leftarrow **AbscontDistribution**(**d** = **function**(x) **exp**(-abs(x) \wedge 3), withStand = TRUE) > AC

> **plot** (AC, panel.first = **grid**(), lwd = 2)

3 Doing it from scratch

If you would like to create new parametric distributions, using already implemented r, d, p, and q functions (e.g. implementing additional distributions realized in another CRAN package), you should probably envisage introducing new distribution S4 (sub-)classes and hence better look at the implementation of some discrete and continuous parametric distribution classes in package "distr". Hint: download the .tar.gz file; extract it to some temp folder; look at subdirectories R and man

The general procedure is as follows

1. introduce a new subclass of class Parameter

- 2. introduce a new subclass of LatticeDistribution/DiscreteDistribution (if discrete) or of class AbscontDistribution (if continuous).
- 3. define accessor and replacement functions for the "slots" of the parameter (e.g. "size" and "prob" in the binomial case), possibly with new generics
- 4. (possibly) define a validity function
- 5. define a generating function
- if existing, define particular convolution methods or similar particular methods for this new distribution class
- 7. create .Rd files for the
 - parameter class
 - distribution class
- 8. if analytic expressions are available, define particular E-, var-, skewness-, and kurtosis-methods and if so, also document¹ the corresponding methods in the distribution class .Rd file

Let's go through the steps in the example case of the Binomial implementation in packages "distr" and "distrEx":

1. in "distr", see source in R/AllClasses.R, lines 187-196

2. in "distr", see source in R/AllClasses.R, lines 972-1000

¹this is new, because so far, all E-, var-, skewness-, and kurtosis-methods for "basic" distributions are documented in the "distrEx" documentation to E, var, ..., but this would not be operational any longer for new derived classes, possibly defined in other, new packages

```
pbinom(q, size = 1, prob = 0.5,
                                              lower.tail = lower.tail, log.p = log.p)
                                                    },
                            q = function(p, lower.tail = TRUE, log.p = FALSE)
                                      \mathbf{qbinom}(\mathbf{p}, \ \mathbf{size} = 1, \ \mathbf{prob} = 0.5,
                                              lower.tail = lower.tail, log.p = log.p)
                                                    },
                            img = new("Naturals"),
                            param = new("BinomParameter"),
                            support = 0:1,
                            lattice = new("Lattice",
                                        pivot = 0, width = 1, Length = 2, name =
                                        gettext(
                                           "lattice of a Binomial distribution"
                                        ),
                           .\log Exact = TRUE,
                           .lowerExact = TRUE
                            ),
              contains = "LatticeDistribution"

The procedure will be similar for any new class of distributions.

Comment In the classes in package "distr" (historically the "oldest" in the development of this project), we still use initialize methods; this is no longer needed, if you provide generating functions; for this "more recent" approach, confer the realization of class Gumbel in package "distrex".

4 Help needed / collaboration welcome

You are — as announced on http://distr.r-forge.r-project.org — very welcome to collaborate in this project! See in particular http://distr.r-forge.r-project.org/HOWTO-collaborate.txt With this you should be able to start working.
